

TC24 Series

PI Temperature Controllers with Digital Display

Features

- Ultra slim wall-mount display control unit to match any decor
- Large easy-to-read liquid crystal display (LCD), with LED backlight (white)
- A stylish bi-directional rotating dial and two compact touch keys to provide ease of operation
- Choice of constant display of ambient temperature or temperature set point value
- Configurable operating parameters
- Choice of °C or °F temperature display via parameter setup menu
- Adjustable proportional band and integral time
- Choice of valve stroke time for 3-wire on-off/ floating models
- Choice of 0-10 VDC or 2-10 VDC outputs via jumper setting
- Field adjustable high and low occupied set point limit values
- Field adjustable cooling and heating unoccupied set point values
- Choice to retain last entered settings on power resumption
- 3-wire floating and 0-10 VDC output models available
- Dual-output models with auto cooling/ heating changeover (deadband operation) and manual override
- Adjustable 1 to 5 K deadband for dual-

output models

- Choice of unoccupied mode activation in operating mode only or in both standby and operating modes
- Field recalibration capability of measured temperature
- External and seasonal changeover temperature sensor capability
- Window contact closure to lock out all controller functions for models with standby mode (not available to models without standby mode)

General

The TC24 Series microprocessor-based temperature controllers with digital display provide 3-wire floating (incremental) or onoff control or a 2-10/0-10 VDC control output. The controllers are designed for use in heating and cooling applications in air handling units or VAV terminal units, for control of water valves, air dampers and VAV controllers.

The microprocessor combines a proportional plus integral (PI) algorithm with advanced adaptive control logic. The proportional component of the algorithm adjusts the control output in response to changes in the measured temperature. The integral component of the algorithm adjusts the control output to eliminate offset (difference between the set point and the actual temperature). This provides

precise and stable control under various system capacity and varying load conditions without the need for tuning or calibrating the control algorithm in the field. The digital display of ambient temperature, set point and operating mode provides the user with an attractive and functional controller that is easy to use.

A bi-directional rotating dial allows change of settings such as temperature set point values.

Ordering

To order, specify complete model number.

Figure 1: Model Number Selection Guide

Model Number	Outputs	Output Signal	Applications	Cooling/Heating Mode	External Seasonal Changeover	External Sensor	Operating Modes	
							Standard Version	Version with Standby mode
TC24-T1-xx	Single	3-Wire On-Off or 3-Wire Floating	Cool Only or Heat Only (2-Pipe System)	Auto by External Device	Yes	Yes	Cool or Heat	Stb-Cool 0r Heat
TC24-T1M-xx	Single	3-Wire On-Off or 3-Wire Floating	Cool Only or Heat Only (2-Pipe System)	Manual Only	No	Yes	Cool or Heat	Stb-Cool-Heat
TC24-T2-xx	Dual	3-Wire On-Off or 3-Wire Floating	Cooling and Heating (4-Pipe System)	Manual and Auto	No	Yes	Cool-Heat-Auto	Stb-Cool-Heat-Cool Auto or Heat Auto/ Stb-Cool Auto or Heat Auto
TC24-A1-xx	Single	0(2)-10 VDC Proportional	Cool Only or Heat Only (2-Pipe System)	Auto by External Device	Yes	Yes	Cool or Heat	Stb-Cool 0r Heat
TC24-A1J-xx	Single	0(2)-10 VDC Proportional	Cool Only or Heat Only (2-Pipe System)	Auto by External Device	Yes	Yes	Cool or Heat	Stb-Cool 0r Heat
TC24-A1M-xx	Single	0(2)-10 VDC Proportional	Cool Only or Heat Only (2-Pipe System)	Manual Only	No	Yes	Cool or Heat	Stb-Cool-Heat
TC24-A1JM-xx	Single	0(2)-10 VDC Proportional	Cool Only or Heat Only (2-Pipe System)	Manual Only	No	Yes	Cool or Heat	Stb-Cool-Heat
TC24-A2-xx	Dual	0(2)-10 VDC Proportional	Cooling and Heating (4-Pipe System)	Manual and Auto	No	Yes	Cool-Heat-Auto	Stb-Cool-Heat-Cool Auto or Heat Auto/ Stb-Cool Auto or Heat Auto
TC24-AH-xx	Dual	0(2)-10 VDC Proportional + 2-Wire On-Off	Proportional Cooling and On-Off Heating (2-Pipe and Electric Heat System)	Manual and Auto	No	Yes	Cool-Heat-Auto	Stb-Cool-Heat-Cool Auto or Heat Auto/ Stb-Cool Auto or Heat Auto

Notes: xx = when omitted = standard models without standby mode (thermostat is always in operating mode)
xx = SB = models with standby mode (thermostat can be switched between standby and operating mode)

The performance specifications above are nominal and subject to tolerances and application variables of generally acceptable industry standards.

The manufacturer shall not be liable for damages resulting from misapplication or misuse of its products.

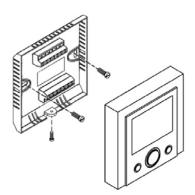

Figure 3: Cover Removal Procedure

Figure 4: Mounting Details

- Loosen the fixed screw.
- Slightly twist the screw driver to crack open the cover from the base.
- Hold the base firmly with one hand and remove the cover with another hand by pulling away from the base forcibly.

Mounting

The temperature controller can be surface mounted or secured to a standard European 75 x 75 x 35 mm electrical box. See Figure 4: Mounting Details. Two mounting screws are included.

Figure 5: Display Control Unit and LCD Layout

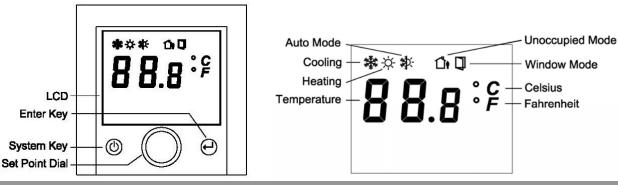

Figure 6: Dimensions in mm

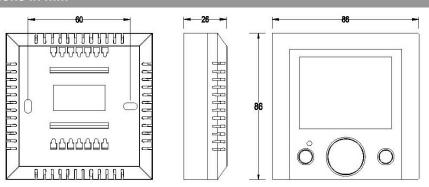

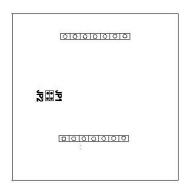

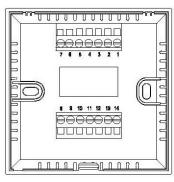

Figure 7: Wiring Terminals and Jumper Settings

JUMPER SETTINGS					
JUMPER NUMBER	JUMPER IN OPEN POSITION	JUMPER IN CLOSED POSITION*			
JP1	With External Sensor	With Built-in Sensor			
JP2	For 2-10 VDC Output	For 0-10 VDC Output			

Notes:

* Factory settings.

JP2 is available in 0-10 VDC/2-10 VDC output models

Controller Errors Reporting

When the following errors are reported on the LED display unit, these errors will prevent the controller from normal operation and all controller functions will be locked out:

- E-1 EEPROM read/write error
- E-2* Temperature sensor open-circuited
- E-3 Temperature sensor short-circuited

* If jumper JP1 is cut open and external sensor is used, E-2 means the external sensor may have been disconnected from Terminals SR1 and GND. Check the external sensor's connectivity and resistive value. If E-2 error is still reported, return the thermostat to the manufacturer for repair.

When the error E-1 or E-3 is reported or when the error E-2 is reported without jumper JP1 being cut and external sensor being installed, return the thermostat to the manufacturer for repair.

Application Notes

- On a single-output cool only or heat only unit, i.e. a unit with only main output being available, connecting a shunting wire between terminals SR2 and GND forces the unit to go into heating mode.
- On a single-output cool only or heat only unit, connecting a TE10-1 or TE10-2 changeover sensor between terminals SR2 and GND will automatically switch the unit between cooling and heating mode. When the sensor temperature exceeds 30°C, the controller enters into heating mode.
- On a dual-output unit, the main output is always associated with the cooling controlled device and the secondary output with the heating controlled device.
- Move jumper JP1 to open position if external sensor is wired to SR1 and GND.
- Move jumper JP2 to open position if 2-10 VDC proportional output is required.
- The changeover sensor should be wrapped around

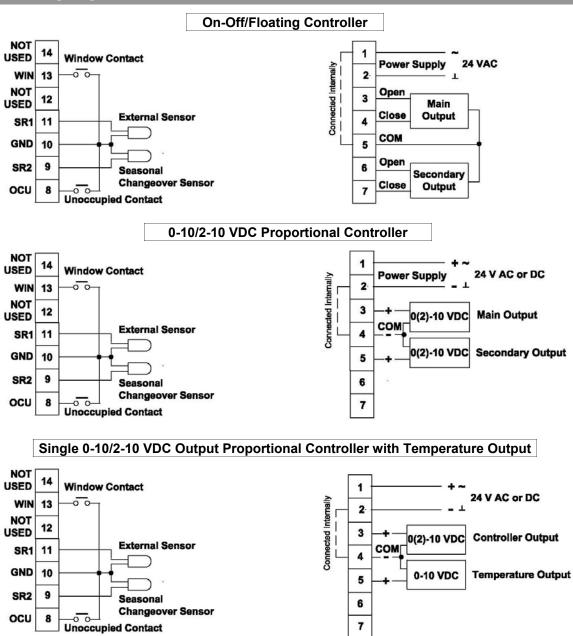

- the supply water pipe when associated with a water system.
- 22 or 24 AWG twisted shielded pair double-insulated cable is recommended as remote sensor wiring and its length must not exceed 25 m.
- Do not bundle and run power wiring and remote sensor wiring in the same conduit.
- Unoccupied contact closure activates unoccupied mode.
- When using either or both of the external temperature and changeover sensors, run the wires away from any electric motors or power wiring. Failure to do so may result in poor thermostat performance due to electrical noise.
- For standard models, It is highly recommended that the 24 VAC power supply is interlocked to the airconditioning system so that the controller is shut down when the air-conditioning system is turned off.

Operation Notes

- For standard models, the controller is always turned on and in active operating mode when power supply is connected. For models with standby mode, the controller can be switched between standby and operating mode with the Φ key.
- When constant display of ambient temperature is selected, LCD displays ambient temperature constantly. Increase or decrease temperature set point by rotating the adjustment dial clockwise or counter-clockwise. During the dial rotation, the LCD shows the existing set point value. Will return to ambient temperature display when all control keys are passive for 5 seconds.
- Press the Φ key momentarily to enter into the desired operating mode: Cool-Heat, Cool or Heat, Cool-Heat-Auto, Standby-Cool or Heat, Standby-Cool-Heat or Standby-Cool Auto or Heat Auto, depending on the model number.
- In unoccupied mode, the factory temperature set points are 26 °C for cooling and 16 °C for heating.
- Unoccupied mode can be activated in the following manner when the unoccupied contact closes: For 2-pipe models with auto seasonal changeover, the unoccupied cooling or heating mode is determined by the status of the SR2 seasonal changeover sensor and the valve output is activated according to the measured temperature.
 - For 2-pipe models with manual seasonal changeover, the unoccupied cooling or heating status is determined by the last status of the occupied mode and the valve output is controlled according to the measured temperature.
 - For 4-pipe models, the unoccupied cooling or heating mode is always determined by the measured temperature and valve output is also activated according to the measured temperature.
 - For models with standby mode, unoccupied mode activation in operating mode only or in both standby and operating mode will be determined by activation setting in setup menu. For standard models without standby mode, unoccupied mode can always be activated whenever the unoccupied contact closes.
 - When unoccupied mode is activated, all keys are locked out and no setting values can be entered.
- Window function is only available and applicable to models with standby mode. Whenever the window contact closes, all controller outputs will be cut off.
- The controller allows authorized service agent to change the following operating parameters in the field:

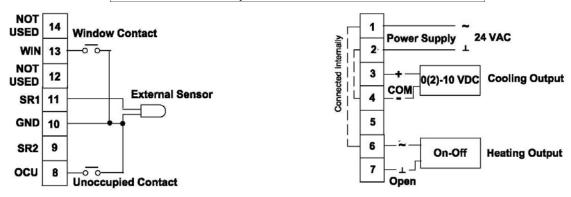

Function	Symbol	Description
MCU firmware (software) revision level	0	Appears after entering the setup menu
Choice of temperature engineering unit	1	I-C = °C (factory setting) I-F = °F
Choice to retain last entered settings on	2	2 ິບກ = program on (factory setting)
power resumption		20F = program off
(hidden when 「II is set)		Note: When Γ l≥ is set and thermostat is in standby mode before power cut-off, only temperature set point values will be restored upon power resumption.
Offset adjustment of temperature indication	3	∃ 2 = temperature indication plus 2 degrees
(field recalibration of measured temperature)		3
ture)		3
		∃- I = temperature indication minus 1 degree ∃-2 = temperature indication minus 2 degrees
Adjustable proportional band for PI control	A	For 0(2)-10 VDC output models:
, rajustable proportional bank for 1 1 control	"	F I = 1 K(1 R) F 3 = 3 K(3 R) (factory setting) F I 0 = 10 K(10 R)
		For 3-wire floating control models:
		A I = 1 K(1 R) A ∃ = 3 K(3 R) (factory setting) A ID = 10 K(10 R);
		setting = A 0 means output acts in on-off control mode.
Choice of integral time for PI control	ь	To set integral time from 0 (0 min) to 30 (30 min) in numeric 1 (1 min) incre-
		ment, factory setting = 15 minutes. Setting = 0 means integral time being turned off.
Choice of valve stroke time for 3-wire float-	С	Choice of 1, 6, 9,12, 15, 18, 21 and 24
ing models	-	□ I = 10 s IZ = 120 s = factory setting [24 = 240 s
Deadband adjustment for dual-output	-	d ID = 1 K(d ≥ = 2 R)d I5 = 1.5 K(d ∃ = 3 R) (factory setting)d5D = 5 K
models only		(d 10 = 10 R)
Upper occupied set point limit setting	Ε	To set upper occupied set point limit, adjustable between current lower set point
		limit value and 40°C (99°F), factory setting 40°C (99°F). The program is set such
		that there is always a minimum separation of 4 degrees maintained between the
		upper occupied set point limit value and the lower set point limit value.
Lower occupied set point limit setting	F	To set lower occupied set point limit, adjustable between current upper set point limit value and 5°C (41°F), factory setting 5°C (41°F). The program is set such
		that there is always a minimum separation of 4 degrees maintained between the
		upper occupied set point limit value and the lower set point limit value.
Unoccupied cooling set point setting	G	To set unoccupied cooling set point, adjustable between current unoccupied
		heating set point value and 40°C (99°F), factory setting 26°C (79°F). The pro-
		gram is set such that there is always a minimum separation of 4 degrees maintained between the unoccupied cooling set point value and the unoccupied heat-
		ing set point value.
Unoccupied heating set point setting	h	To set unoccupied heating set point, adjustable between current unoccupied
		cooling set point value and 5°C (41°F), factory setting 16°C (61°F). The program
		is set such that there is always a minimum separation of 4 degrees maintained
		between the unoccupied cooling set point value and the unoccupied heating set point value.
Choice of activation of unoccupied mode	L	L- I = Unoccupied mode can only be activated when thermostat is in operating
(hidden when [1] is set)		mode (factory setting)
,		L-⊇ = Unoccupied mode will be activated whenever thermostat is energized
Choice of operating sequence for dual-output	٦	r- I = to set operating sequence of Cool-Heat-Auto-Fan Only-Stb
models only (hidden when Γ I I is set)		(factory setting)
Choice of "1" or "1N" re	 	r-2 = to set operating sequence of Auto-Stb
Choice of "1" or "1M" model	E	L- I = to set operating sequence of Cool Heat (factory setting for "1" models)
		Ł- ₹ = to set operating sequence of Cool-Heat/Stb-Cool-Heat (factory setting for "1M" models)
Choice of constant display of ambient tem-	u	u⁻ <i>l</i> = constant display of ambient temperature (factory setting)
perature or temperature set point value		u-2 = constant display of set point value
Choice of with or without standby mode	ГΙ	Γ I I = without standby mode (factory setting for standard models)
		Γ I₂ = with standby mode (factory setting for models with standby/operating
		function)
Restoration of default factory settings	Γ5	Γ5 I = Retain current settings (factory setting)
		Γ52 = Restore default factory settings
